# Outline

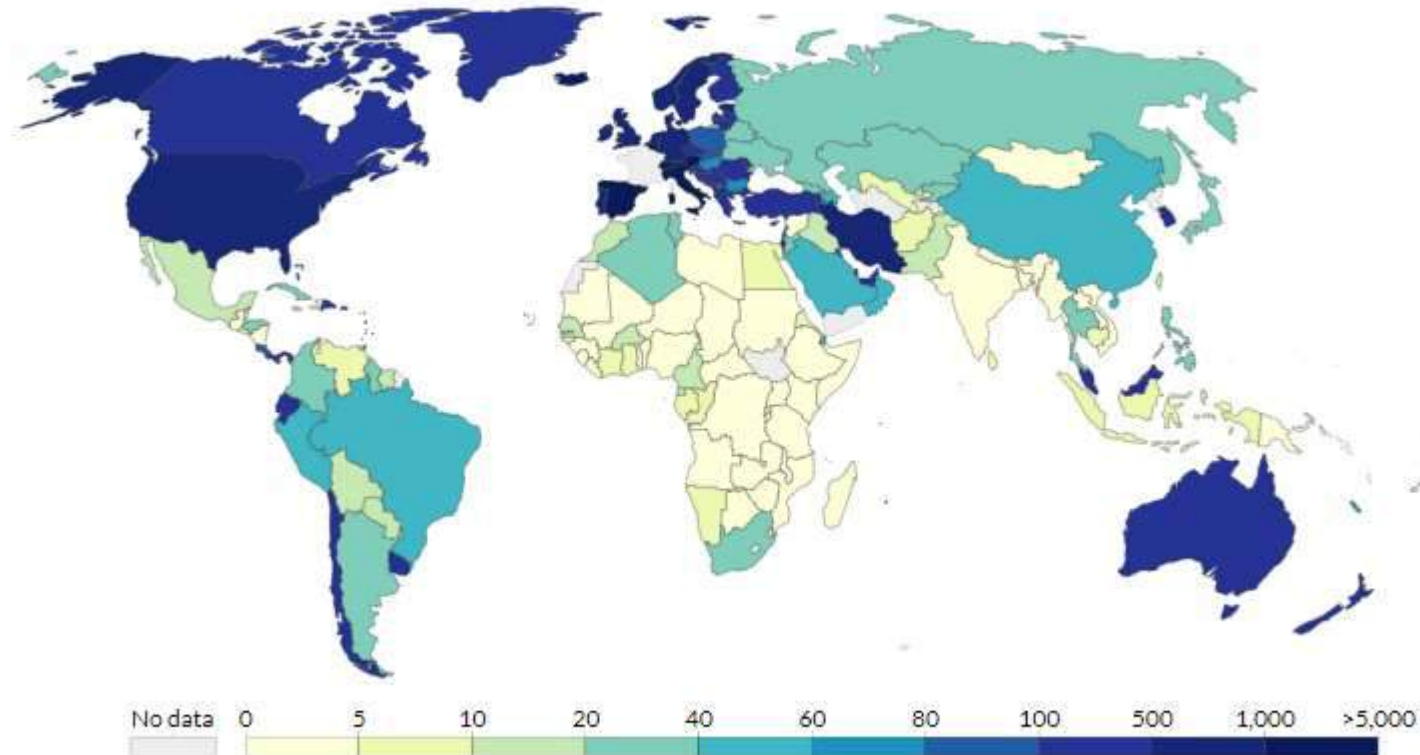

- SARS-CoV-2 virus
  - Features
  - Life Cycle
- COVID-19 Technologies
  - Which
  - How should we use them
  - When must we use them

COVID-19 is the Coronavirus Disease caused by the **SARS-CoV-2 virus**, declared as a new pandemic by the World Health Organization (WHO) as of 11<sup>th</sup> March, 2020.

### Total confirmed cases of COVID-19 per million people, Apr 4, 2020

The number of confirmed cases is lower than the number of total cases. The main reason for this is limited testing.

Our World  
in Data

Source: European CDC – Situation Update Worldwide – Last updated 4th April, 11:30 (London time)

Note: The large number of cases globally and in China on Feb 17 is the result of a change in reporting methodology.

CC BY

COVID-19 is the Coronavirus Disease caused by the **SARS-CoV-2 virus**, declared as a new **pandemic** by the World Health Organization (WHO) as of 11<sup>th</sup> March, 2020.

**We need more knowledge to understand....**

... causes and reasons for its rapid spread and population differences

- Prevention

... the biology and pathophysiology of the disease

- Treatments and vaccines

.... how are we going to recover our activities and previous lifestyle

- Epidemiology

# SARS-CoV-2 virus

SARS-CoV-2 is a single-stranded RNA, enveloped virus, belonging to the  $\beta$ -coronavirus family. This virus is able to enter the human cells by binding of its spike (S) protein to ACE2 enzyme.

ACE2 (Angiotensin converting enzyme 2) is expressed in the membrane of different cell types as a part of the renin-angiotensin (RAS) system, involved in the regulation of blood pressure.

# Technologies

*...for SARS-COV2 detection*

# COVID-19 Technologies

Li et al. *J Pharm Anal* 2020.

The highest

- Sensitivity
- Specificity

Flu	COVID-19	SARS	MERS
			
Influenza virus	SARS-CoV-2	SARS-CoV	MERS-CoV

# COVID-19 Technologies

Spike (S) protein

Envelop proteins  
(N protein)

RNA

Technologies

- Immunoassays
- RT-PCR
- RNA NGS sequencing

The highest

- Sensitivity
- Specificity

Flu	COVID-19	SARS	MERS
			
Influenza virus	SARS-CoV-2	SARS-CoV	MERS-CoV

# COVID-19 Technologies

## Technologies for SARS-CoV-2

### Immunoassay

- Antigen Detection
- Antibodies (IgG and IgM) detection (ELISA and PoC)

### RNA detection and analysis

- RT-PCR
- Next Generation Sequencing (NGS)

# COVID-19 Technologies

## Immunoassays and Immune response

When a person is infected with a pathogen, its immune system reacts to this infection building antibodies against this antigen

Specific recombinant antigens and antibodies are targeted to S and N SARS-CoV-2 proteins

### Antibodies: Immunoglobulines

- IgM is the first antibody produced during an immune response
- IgA is involved in primary defense and frequent in mucosal secretions
- IgG is produced in a delayed response (delayed immunization)

IgM

# COVID-19 Technologies

## Immunoassays

*(SEIMC guidelines)*

- Antigen Detection

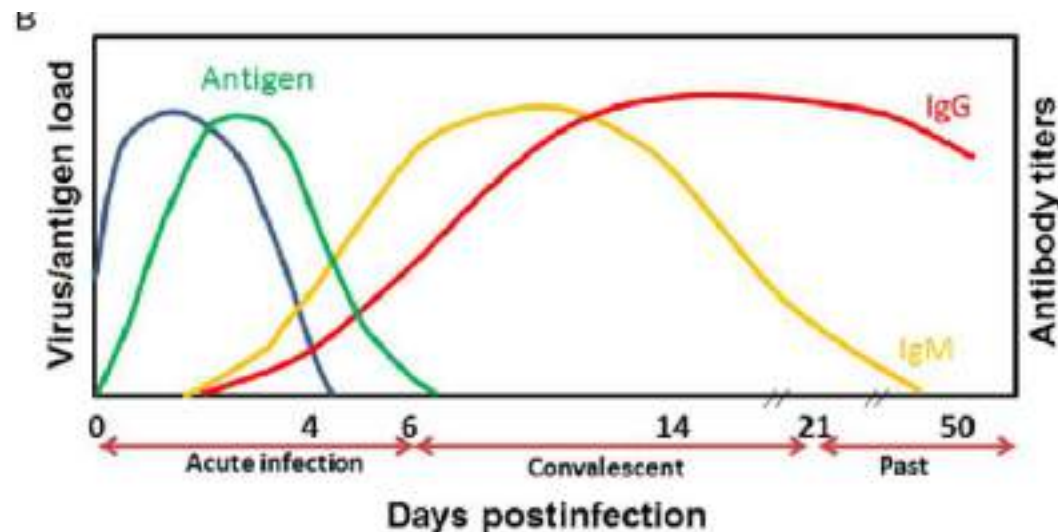

Overall sensitivity is very low < 50% (SEIMC), are not (yet) recommended for COVID 19 acute phase

- Antibody (IgG and IgM) Detection (ELISA or Point of Care)

Kinetic of immune response starts around day 5-6 postinfection

High sensitivity after day 10 postinfection

High variability among the kits in the market (Try fist!!!)

Antigen Down ELISA

# COVID-19 Technologies

## Immunoassays

- Antibody (IgG and IgM) Detection (Point of Care)  
Reverse detection of antigens by lateral flow

Li et al. *J Med Virol.* 2020

# COVID-19 Technologies

## Immunoassays

- Antibody (IgG and IgM) Detection (ELISA)  
Reverse detection of antigens by lateral flow

**INDIRECT ELISA**

# COVID-19 Technologies

## Nucleic acid detection (RNA)

- RT-PCR (*Real Time-Polymerase Chain Reaction*)

Allow the detection and quantification of small quantities of nucleic acids

- NGS (Next Generation Sequencing)

Allow the detection, quantification and reading of the sequence of small nucleic acid fragment or the whole genome of the virus

### NCBI-Reference-Sequence: NC\_045512.2

# COVID-19 Technologies

## Nucleic acid detection (RNA)

- Design
- RNA extraction

Common procedures to both technologies

Important impact on the sensitivity and specificity of the technologies

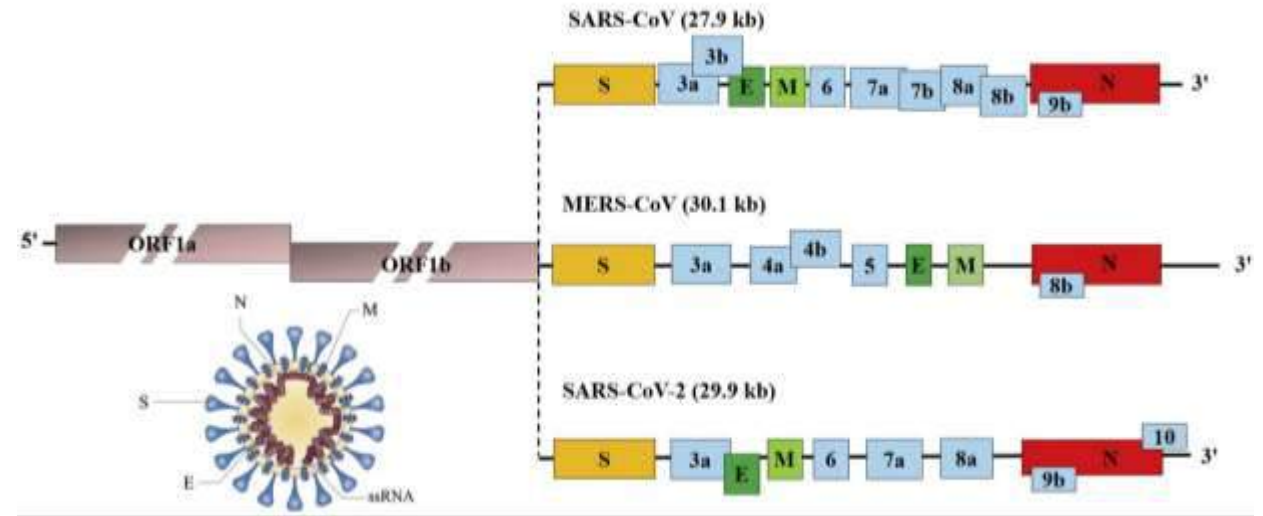

# COVID-19 Technologies

## Nucleic acid detection (RNA)

- Design

## Specificity

There is no interference from other organisms that could be amplified by our primers

Li et al. *J Pharm Anal* 2020.

# COVID-19 Technologies

## Nucleic acid detection (RNA)

- Design

*Comparison of 185 complete SARS-CoV-2 genomes (GISAID database)*

*Primer and probes sequences for SARS-CoV-2 ORF1ab, S gene, and N gene assays had 100% homology to all SARS-CoV-2 analyzed, except EPI\_ISL\_407084*

### Sensitivity

*Test detects all known variants of SARS-CoV-2 (except EPI\_ISL\_407084)*

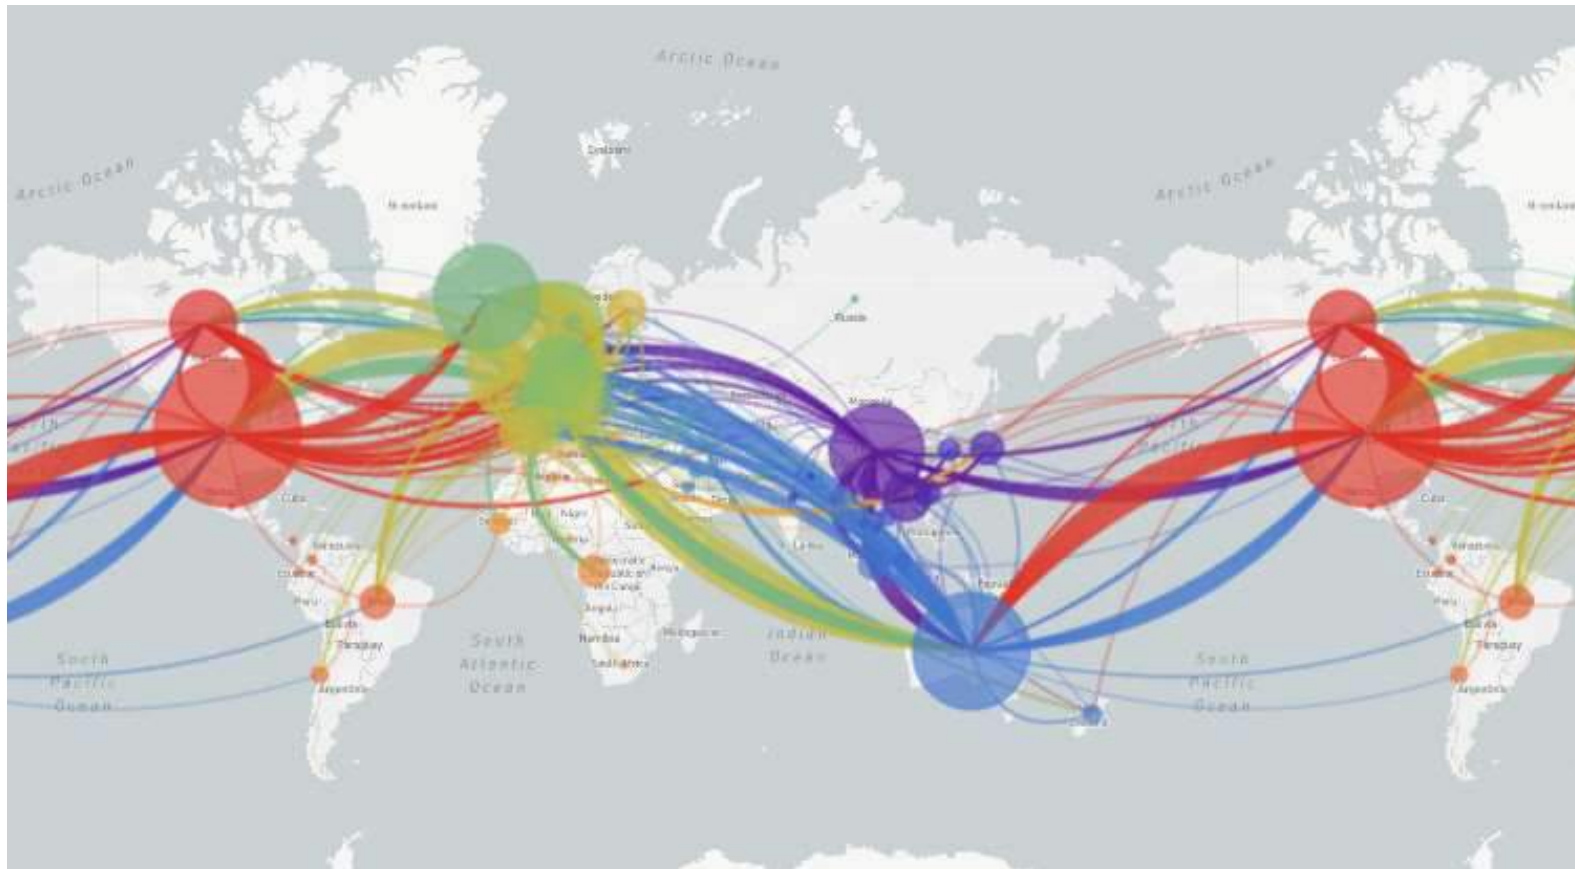

# COVID-19 Technologies

## Nucleic acid detection (RNA)

# COVID-19 Technologies

## Nucleic acid detection (RNA)

# COVID-19 Technologies

## Nucleic acid detection (RNA)

- Extraction

RNA (ribonucleic acid) is a very labile molecule and it degrades very easily

We can transform single strand RNA (ss RNA) into double strand complementary DNA (ds cDNA) becoming more stable and easier to handle

*Prenalytix and preservation of the quality of sample significantly affects the sensitivity of the technique*

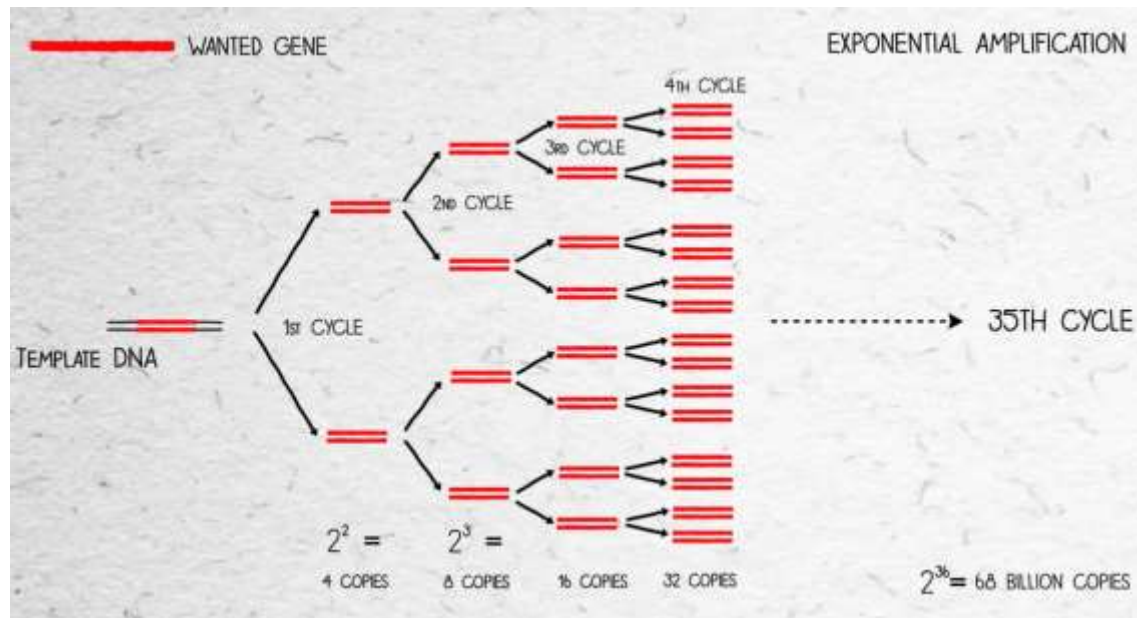

# COVID-19 Technologies

## Nucleic acid detection (RNA)

- RT-PCR (*Real Time-Polymerase Chain Reaction*)

Allow the detection and quantification of small quantities of nucleic acids

# COVID-19 Technologies

## Nucleic acid detection (RNA)

# COVID-19 Technologies

## Nucleic acid detection (RNA)

- NGS (Next Generation Sequencing)

Allow the detection, quantification and reading of the sequence of small nucleic acid fragment or the whole genome of the virus

# COVID-19 Technologies

## Validation

All test must be validated before clinical uses

- **Analytic Validity**

- **Limits of detection (LoD)**

Limits of detection of the technique must be measured and documented

LoD is the lower SARS-CoV-2 viral load or Genomic Copy Equivalents (GCE) that can be detected in, at least, 95% samples analyzed

Our LoD for RT-PCR is 250 copies/ml of nasopharyngeal fluid

10 GCE por reaction

- **Technology Robustness**

Technology replicates around the limits of detection

- **Clinical Validity**

Results correlate in a more than 100 clinical samples

# COVID-19 Technologies

## Validation

All test must be validated before clinical uses

- Clinical Validity

Table 9 NP Clinical Evaluation Study

Final RNA Concentration in Sample	Number of Positives	Mean Ct	Mean Ct	Mean Ct
		S gene	ORF1ab	N gene
2X LoD	20/20 <sup>b</sup>	30.9	30.6	29.3
3X LoD	5/5	30.0	30.1	28.8
5X LoD	5/5	28.7	29.0	27.9

<sup>a</sup> Two samples gave inconclusive results and were not re-tested due to unavailability of the testing material.

<sup>b</sup> One sample initially gave an inconclusive result and was retested. The result was positive after the retest. Mean Cts are calculated including retest result.

# Validación del test

- La NY Department of Health concluye que el mejor abordaje se realiza obteniendo la muestra mediante hisopo nasofaríngeo por su capacidad para concentra mayor cantidad del virus.
- En ausencia de nasofaríngeo, la FDA valida la utilización de orofaríngeo+nasal.

Bureau of Communicable Disease Control (BCDC)

**HEALTH ADVISORY: NOVEL CORONAVIRUS DISEASE (COVID-19)  
UPDATE ON SPECIMEN COLLECTION AND HANDLING  
TO INCLUDE NASAL SWAB AND OROPHARYNGEAL SWAB SPECIMEN ALTERNATIVE**

#### **SUMMARY**

- COVID-19 community transmission has been detected in New York State.
- COVID-19 testing is available at the NYSDOH Wadsworth Center and select clinical laboratories.
- For any suspected COVID-19 cases, ensure appropriate infection control precautions and immediately notify the infection control lead at your facility and the local health department (LHD).
- Review local testing options for those who do not require clinical outpatient/inpatient medical care.

#### **SITUATION UPDATE**

- As of March 24, 2020, there have been 48,289 COVID-19 cases with 590 deaths in the United States.
- As of March 24, 2020, [New York](#) had 25,665 reported cases of COVID-19 with 14,904 in NYC and 10,176 in the rest of state with 210 deaths.

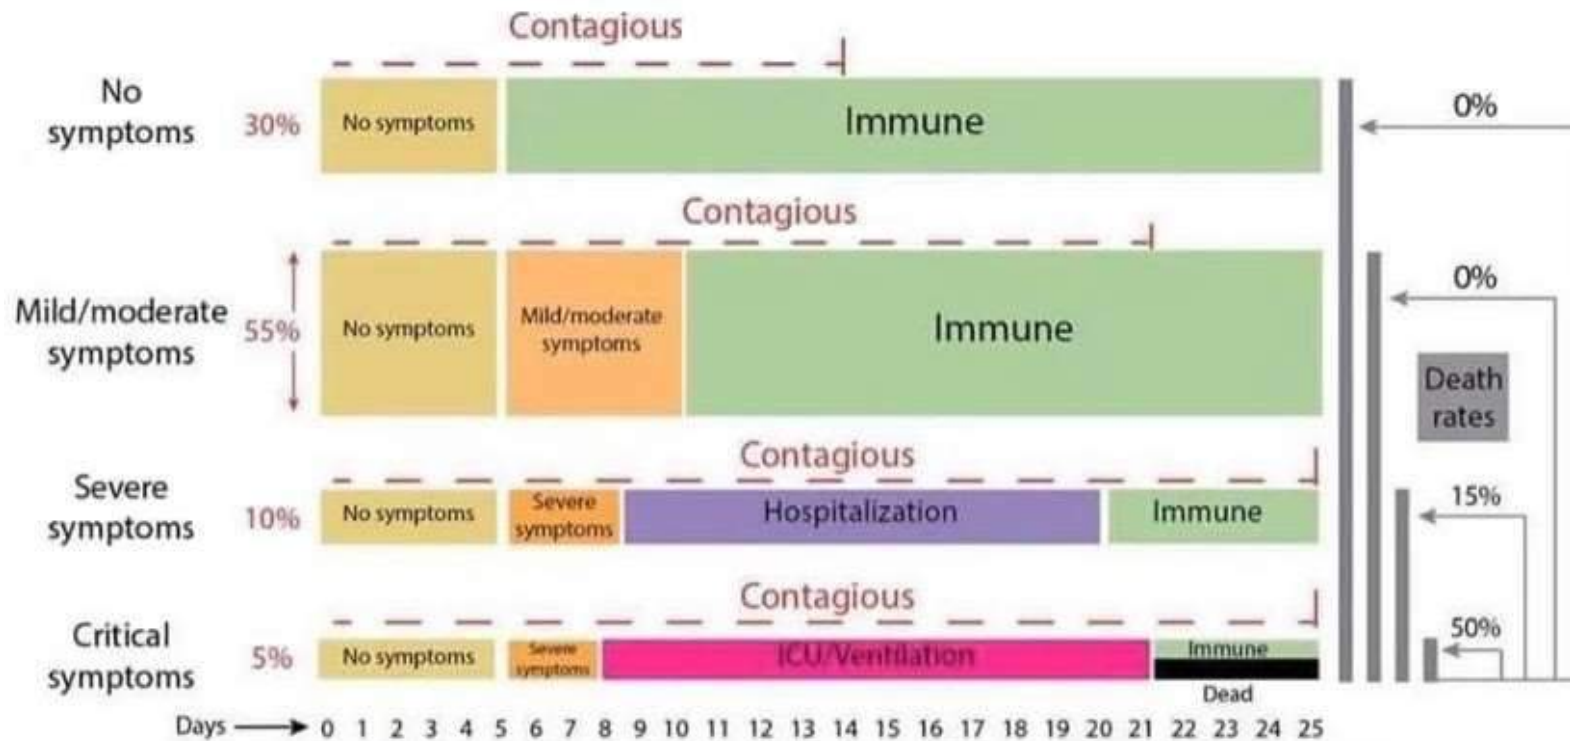

#### **COVID-19 SPECIMEN COLLECTION AND HANDLING**

- Collect a **nasopharyngeal (NP) swab** for initial diagnostic testing for COVID-19, placed in a vial containing Viral Transport Media (VTM) or Molecular Transport Media (MTM).
  - Oropharyngeal swab and sputum are no longer recommended for initial testing.
  - Sputum or lower respiratory specimens, such as bronchoalveolar lavage (BAL) or tracheal aspirate testing, may be considered, as clinically appropriate, and can be sent to a commercial or clinical laboratory. Collection of sputum should only be done for those patients with a productive cough. Induction of sputum is not recommended.

# Take Home Messages

- Testing is crucial for:
  - A(pre)symptomatic individuals in early stages (tracing and isolation)
  - Accurate diagnostic of patients and monitorization of immunization
- Several types of tests
  - SARS-CoV-2 RNA (its genome)
  - Immuno response of the patient (Antibodies and antigens)
- Detect different physiological phases of infection
  - SARS-CoV-2 presence RNA (viral load)
  - Immuno response and immunization status
- Combined use of both approaches should be the standard
- Testing requires
  - Experienced professionals and high expertise in the use of technologies
  - Validation (in house) of technologies
  - Pre-analytical process is crucial

# “Our key message is: **test, test, test**”

The image is a screenshot of a BBC News article. At the top, the BBC logo is on the left, followed by a 'Sign in' button and navigation links for News, Sport, Reel, Worklife, Travel, Future, and More. A search bar is on the right. Below this is a red 'NEWS' banner with sub-navigation for Home, Video, World, UK, Business, Tech, Science, Stories, Entertainment & Arts, Health, World News TV, and More. Underneath, there are regional links: World (underlined), Africa, Asia, Australia, Europe, Latin America, Middle East, and US & Canada. The main content area features a video player showing Dr. Tedros Adhanom Ghebreyesus, WHO Director-General, speaking at a press conference. He is wearing a dark suit, a red tie, and glasses. The background is a blue wall with the WHO logo and name in multiple languages. A nameplate in front of him reads 'Dr Tedros Adhanom Ghebreyesus WHO DIRECTOR-GENERAL'. To the right of the video is the article title 'WHO head: 'Our key message is: test, test, test'', a short summary paragraph, a date '16 Mar 2020', and social sharing icons for Facebook, WhatsApp, Twitter, Email, and a general 'Share' button.

**WHO head: 'Our key message is: test, test, test'**

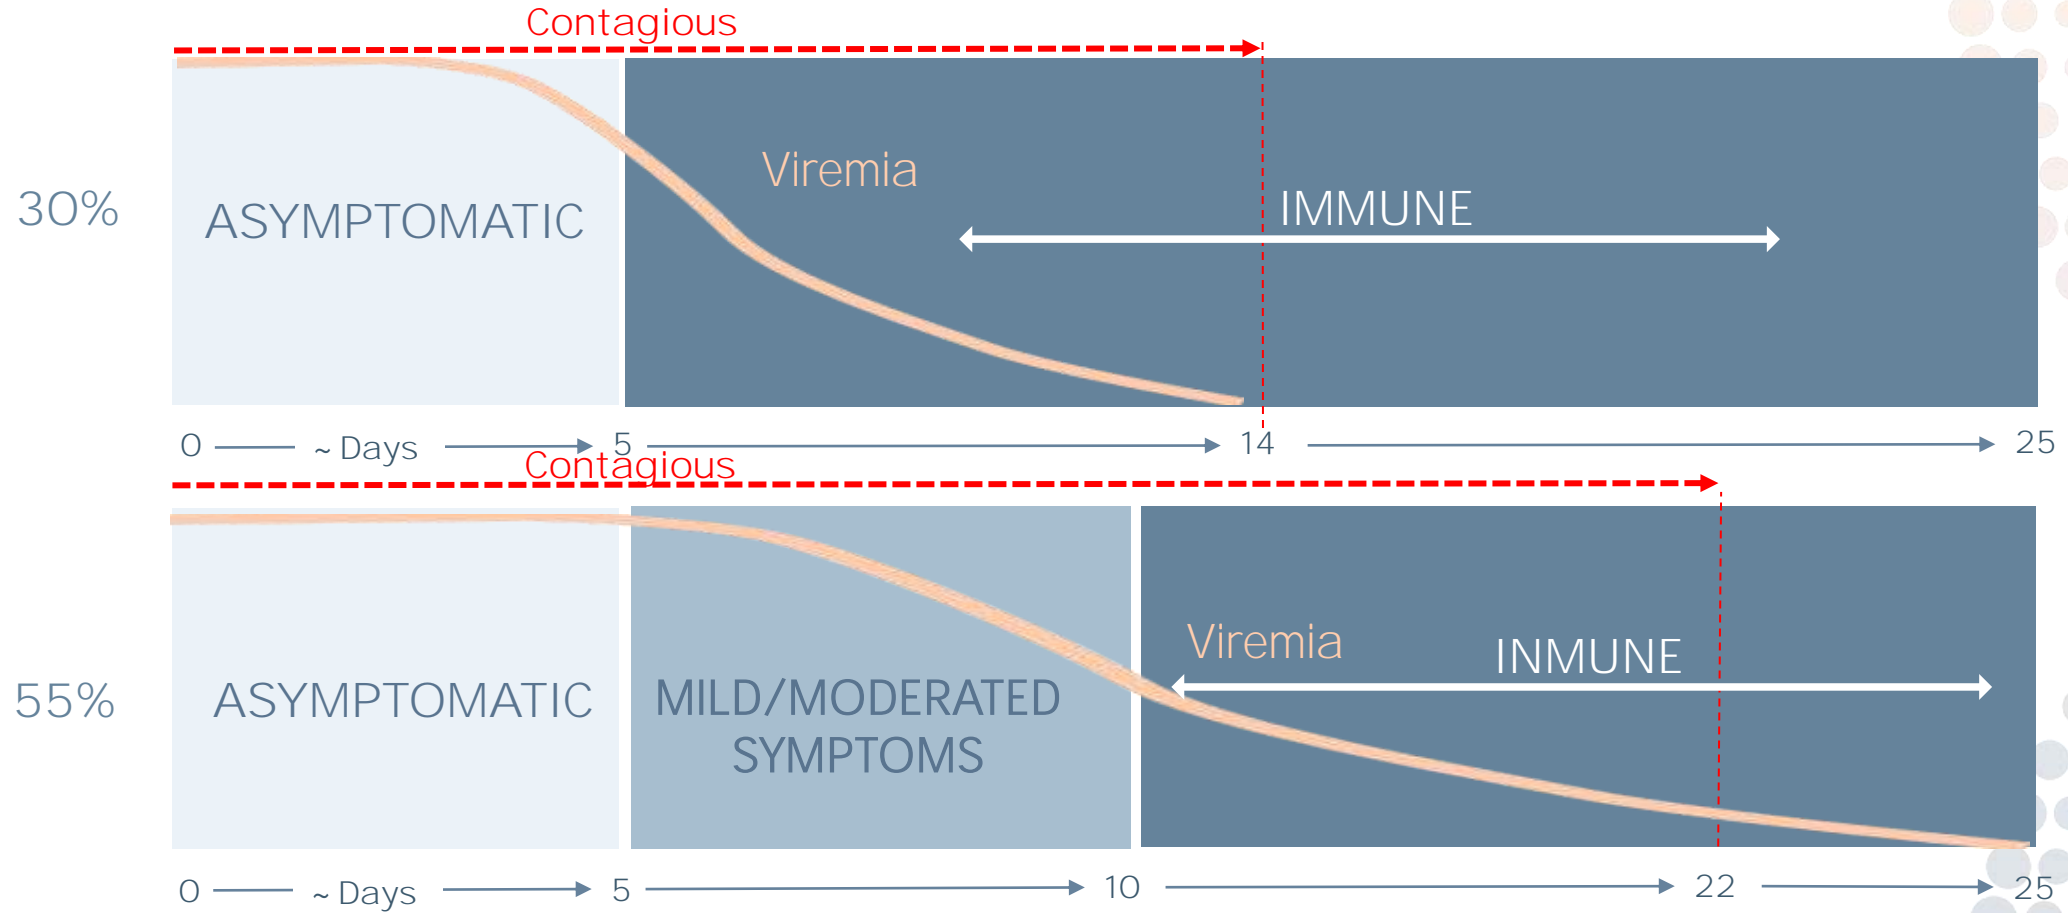

World Health Organisation head Tedros Adhanom Ghebreyesus says there has not been an urgent enough escalation in testing, isolation and contact tracing, which should be the "backbone" of the global response.

He said it is not possible to "fight a fire blindfolded", and social distancing measures and handwashing will not alone extinguish the epidemic.

# Técnicas para detectar COVID-19:

Cuáles, cómo y cuándo

Javier García-Planells, Ph. D.

Clinical Development & Scientific Advisor Rare Diseases Director, Igenomix

Presidente de la Asociación Española de Diagnóstico Prenatal (AEDP)

European Molecular Genetics Quality Network (EMQN) Assessor

# COVID-FREE CLINICS

El empleado visita la web y el contenido educativo

El servicio médico de la compañía firma el TRF y el empleado el consentimiento informado

Frotis nasofaríngeo + toma de sangre en punto de extracción o servicio médico de la empresa

Realización test en el laboratorio de Igenomix

Envío del informe del test\*\*

Dashboard con datos agregados a nivel de compañía

Envío al empleado de un "pasaporte digital"

(\*\*) En caso de PCR positivo y de acuerdo a regulación actual, Igenomix deberá notificar el resultado a las autoridades sanitarias.

# WHO testing recommendations

## Laboratory testing strategy recommendations for COVID-19

Interim guidance  
22 March 2020

## Global surveillance for COVID-19 caused by human infection with COVID-19 virus

Interim guidance  
20 March 2020

- All countries should increase their level of preparedness, alert, and response to identify, manage, and care for new cases of COVID-19; laboratory testing is an integral part of this strategy.
- Any persons meeting the criteria for testing should be tested for COVID-19 infection using available molecular tests.

Countries that have not yet reported cases  
Countries dealing with sporadic cases  
Considerations for countries dealing with clusters of cases

WHO recommends that all suspect cases be tested for COVID-19

Countries dealing with community transmission

Laboratories will need to be prepared for the significant increase in the number of specimens that need to be tested for COVID-19. Testing constraints should be anticipated, and prioritization will be required.

# Coronavirus Covid-19: ESHRE Statement on Pregnancy and Conception: March 14th, 2020

*“There is no strong evidence of any negative effects of Covid-19 infection on pregnancies, especially those at early stages, as indicated by the latest updates from the Centers for Disease Control and Prevention (CDC) in the USA and others in Europe.”*

## **PATIENT'S MANAGEMENT**

As a precautionary measure - and in line with the position of other scientific societies in reproductive medicine - we advise that:

1. All fertility patients considering or planning treatment, even if they do not meet the diagnostic criteria for Covid-19 infection, should avoid becoming pregnant at this time.
2. For those patients already having treatment, we suggest considering deferred pregnancy with oocyte or embryo freezing for later embryo transfer.
3. Patients who are pregnant or those (men and women) planning or undergoing fertility treatment should avoid travel to known areas of infection and contact with potentially infected individuals.

# ASRM Patient Management and Clinical Recommendations during the Coronavirus (COVID-19) Pandemic: March 17th, 2020

*“Given the information we do have, while it would be wise for individuals with confirmed or presumed COVID-19 infection to avoid pregnancy, there appears to be no cause for alarm for those already pregnant.”*

## **PATIENT'S MANAGEMENT**

1. Suspend initiation of new treatment cycles, including ovulation induction, intrauterine inseminations (IUIs), in vitro fertilization (IVF) including retrievals and frozen embryo transfers, as well as non-urgent gamete cryopreservation.
2. Strongly consider **cancellation of all embryo transfers** whether fresh or frozen.
3. Continue to care for patients who are currently “in-cycle” or who require urgent stimulation and cryopreservation.
4. Suspend elective surgeries and non-urgent diagnostic procedures.
5. Minimize in-person interactions and increase utilization of telehealth.
6. Patients with active COVID-19 should not undergo fertility treatment, unless they require urgent fertility preservation.

# Reactions to the ASRM Patient Management and Clinical Recommendations

The Fertility Providers Alliance (FPA) that represents over 400 fertility specialists, requested ASRM to revisit and reshape its recommendations to the reproductive endocrinology community, based in 3 reasons:

1. The actual public health burden created by the continuation of fertility care

The vast majority of fertility centers across USA are free-standing medical facilities that operate without hospital affiliation.

## **2. The classification of infertility treatment as 'non-urgent' or elective**

The reproductive health community has fought diligently to recognize infertility for what it is: a disease state that includes many diverse medical conditions.

3. The harmful consequences of an indeterminate delay in access to care

For these patients, "revisiting guidelines periodically as the pandemic evolves" creates an anguishing and indeterminate state of reproductive limbo.

# Validación del test

## ✓ EVALUACIÓN CLÍNICA

- El test de Igenomix ha sido validado en nuestras instalaciones siguiendo las recomendaciones oficiales de los organismos oficiales y la FDA.
- Comprueba que distintas concentraciones de límite de detección más grandes, siempre detectan el 100% de los casos:

Tabla 9 NP Estudio de evaluación clínica

RNA Final- Concentración por muestra	Nº de positivos	Ct Promedio gen S	Ct Promedio gen ORF1ab	Ct Promedio gen N
2XLoD	20/20b	30,9	30,6	29,3
3XLoD	5/5b	30	30,1	28,8
5XLoD	5/5	28,7	29	27,9

a Dos de las muestras dieron resultados no concluyentes y no fueron reanalizadas debido a la no viabilidad de la r  
b Una de las muestras dio inicialmente un resultado no concluyente y fue reanalizada. El resultado fue positivo tras el reanálisis. Los Cts promedio se han calculado incluyendo los resultados del reanálisis

# Take Home Messages

- Testing is crucial for:
  - A(pre)symptomatic individuals in early stages (tracing and isolation)
  - Accurate diagnostic of patients and monitorization of immunization
- Several types of tests
  - SARS-CoV-2 RNA (its genome)
  - Immuno response of the patient (Antibodies and antigens)
- Detect different physiological phases of infection
  - SARS-CoV-2 presence RNA (viral load)
  - Immuno response and immunization status
- Combined use of both approaches should be the standard
- Testing requires
  - Experienced professionals and high expertise in the use of technologies
  - Validation (in house) of technologies
  - Pre-analytical process is crucial
